

2011 Recommended Immunizations for Children from Birth Through 6 Years Old

NOTE: If your child misses a shot, you don't need to start over, just go back to your child's doctor for the next shot. The doctor will keep your child up-to-date on vaccinations. Talk with your doctor if you have questions.

FOOTNOTES

^s HepA vaccination is recommended for high-risk children older than 2 years. Children with certain medical conditions may also need a dose of meningococcal vaccine (MCV4) and pneumococcal vaccine (PPSV). HepA vaccination may be administered to any child older than 2 years for whom immunity is desired. See vaccine-specific recommendations at <http://www.cdc.gov/vaccines/pubs/ACIP-list.htm>.

* Two doses given at least four weeks apart are recommended for children aged 6 months through 8 years of age who are getting a flu vaccine for the first time. Children who only got one dose in their first year of vaccination should get two doses the following year.

See back page for more information on vaccine-preventable diseases and the vaccines that prevent them.
